Introduction

The E-SDS-CELC(P) is a smoke detection sensor intended for connection to an NTI E-MICRO-T(RHP), E-16D/5D/2D, E-MINI-LXO, or E-1W(P) (ENVIROMUX). When properly connected, the E-SDS-CELC(P) will provide signals to the ENVIROMUX that with proper configuration will result in alert messages being sent to users of the ENVIROMUX. The E-SDS-CELC(P) has screw terminals for easy user connections and the E-SDS-CELCP includes a 12VDC AC adapter.

This Photoelectric smoke detector (hereinafter called Detector) detects smoke using a couple of infrared diodes. The principle of detecting is based on the fact that a granule of smoke can reflect infrared light. Infrared diodes are placed in a special chamber. The chamber can shield external light, but doesn't prevent smoke from entering it. In the absence of smoke, the diodes can detect very weak infrared light. As smoke enters the chamber, the diodes will receive more and more light. When the smoke reaches a certain density, the Detector will sound out an alarm signal. In order to reduce interference and lower power consumption, the emitting circuit uses a pulse signal. The Detector has a special structural design and ASIC, providing a dustproof, mothproof and anti-outside light interference feature. The Detector is suitable for detecting the smoke in a house, shop, hotel, restaurant, office building, school, bank, library, etc.

Product Features

The detector works once connected directly to DC power. A flashing LED indicates the Detector is working normally and an LED that stays ON solid indicates an alarm condition. Normally-closed output contacts will open in an alarm condition. Connections to these contacts are made when the Detector is secured to the mounting base.

- Infrared Photoelectric Smoke Detector
- LED alarm indicators
- Selectable Alarm Output N/C or N/O Relay (Default is N/C)
- Selectable Latching Feature (Default is latch ON)
- Open Contact(LED Indicating Alarm)
- Anti-light, Mothproof, Dustproof
- Stainless steel shield, Anti-RFI (20V/m-1GHz)

Note: The E-SDS-CELC(P) is NOT intended to be used as a primary fire and smoke detection device.

Preparation for Installation

1. There should be no large objects that would block airflow within 0.5m (20 inches) of the Detector.
2. There must be no source of wind flow within 1.5m (60 inches) of the Detector.
3. The Detector should be mounted more than 0.5m (20 inches) from any wall.
4. The distance between two Detectors can be no less than 15m (50 feet) and the distance between Detector and corner must be less than half of the distance between Detectors.
5. Always install the Detector on a horizontal surface. If it must be installed on a slanted surface, the angle of slant must be less than 45 degrees.
6. Clean the Detector by brushing the openings in the head with a soft brush every six months to ensure the sensitivity and life of the product. Be sure to power OFF the Detector before cleaning.

Clean every six months with a soft brush
Switch Contact Connection

1. Connect two 18-22 awg wires (not supplied) to “Digital In” terminals “+” and “−” on the E-16D (sets 1-8), “Digital In” terminals on the E-MINI-LXO, E-MICRO-T(RHP), E-1W(P)(set 1 or 2), E-2D and E-5D (sets 1-5) or any set of dry contacts on the E-MINI (set 1, 2, 3 or 4). (All shown in the images below)

2. Connect the other end of those two wires to the smoke detection sensor base at terminals “L1 Out” and “R”.

For more Digital In connections in conjunction with the E-16D/5D/2D, add an E-DI16DO16(R) Digital Input/Output Expander. See [http://www.networktechinc.com/io-expander.html](http://www.networktechinc.com/io-expander.html) for more details.

Power Connection

For Model E-SDS-CELC:

1. Connect two 18-22awg wires (not supplied) between the E-16D and the E-SDS-CELC as shown below. (Wiring for E-2D and E-5D also shown.)
   a. Connect one wire between “12V” on the SYSTEM and terminal “L1IN” on the smoke detector.
   b. Connect the other wire between “GRD” (ground) on the SYSTEM and terminal “L2” on the smoke detector.

2. Be sure to tighten terminals to secure each conductor.
When a 12VDC power supply is not available on the SYSTEM (for example, E-MICRO-T(RHP), E-1W(P) and E-MINI-LXO do not include terminals to provide 12VDC power to sensors), model E-SDS-CELCP can be used.

1. Connect the AC adapter wire labeled “PLUS 12” to terminal “L1IN” on the smoke detection sensor.
2. Connect the AC adapter wire labeled “NEG” to terminal “L2” on the smoke detection sensor.
3. Add a jumper wire between terminals “L2” and “R” on the smoke detector.
4. Be sure to tighten terminals to secure each conductor.
Wired using this method the smoke detector must be manually power-cycled in order to reset it when it goes into alert.

Wired using this method the smoke detector can be power-cycled through the web interface when it is in alert. Make sure that no sensors are configured to activate the output relay when in or out of alert. (See page 7)
For Model E-SDS-CELC-E7:

The E-SDS-CELC-E7 includes a 7 foot pre-wired cable with RJ45 connector (wiring shown below) for plug in to either an available RJ45 Sensor port in an E-2D/5D/16D or into a pigtail wired to a Digital Input on an E-2D/5D/16D. No additional power supply is required. The 7 foot cable can be extended to up to 1000 feet using a CAT5 patch cable (minimum 24AWG) using the supplied RJ45 coupler.

Wiring method using a pigtail connected to Digital Input

The E-SDS-CELC(-E7) draws 18mA @ 12VDC

Connection method using a pigtail connected to RJ45 Sensor port

Extend sensor up to 1000 feet with CATx cable (min. 24AWG) using inline coupler
To wire your own CATx patch cable to an E-SDS-CELC sensor, follow the wiring instruction below.

Wiring of E-SDS-CELC for connection using RJ45 pigtail

(Applicable to E-xD Models only)

CATx Cable, can be extended up to 1000 feet (Minimum 24AWG)

View looking into RJ45 Socket (Using CATx cable wired to T568B standard)
Selectable Features

You can select whether the alarm output relay is in a normally-closed (the default) or normally-open position, and whether the alarm should latch ON until the unit is power-cycled (default setting) OR auto-reset and return to OFF when the alarm condition clears.

To change this setting, remove the configuration cover with a very small flat-blade screwdriver or similar tool. Place the slide switches in the desired position.

Note: The E-SDS-CELC(P) is NOT intended to be used as a primary fire and smoke detection device.

Install Detector to Base

Connect the Detector to the base. Line the raised line on the Detector up with the right-hand line on the base. Press the Detector into the base all the way. Then rotate the Detector clockwise until the line on the Detector lines up with the left-hand line on the base.
Operation

1. Power up the ENVIROMUX (if not already powered ON), or, when used, connect the AC adapter to an appropriate power source. The LEDs on the Detector will flash red to indicate the sensor is functioning and in status-ready condition. The LEDs will illuminate solid red when smoke is detected.

2. Configure the ENVIROMUX to report signals from the connected dry contact sensor as smoke detection sensor alerts. (Refer to the ENVIROMUX manual for details on configuration—see also example below and on the following pages.) When smoke is detected, the switch terminals on the E-SDS-CELC(P) will close to cause an alert message to be sent from the ENVIROMUX.

Example of sensor configuration in E-MICRO-T(RHP)

Cycle Sensor Power on E-xD Models

When the smoke detection sensor senses smoke and an alert condition is triggered, in order to reset the smoke detector to a ready state after the presence of smoke has been resolved, the smoke detector must be power-cycled.

A “Cycle Sensor Power” button (below) is provided for each sensor connected to the “Digital In” terminals on the E-16D (locally-powered-by Digital Inputs only). To momentarily disrupt power to any sensor powered-by a Digital Input terminal, click on this button. The 12VDC power will be disrupted to the sensor for 5 seconds and then automatically restored.

**Note:** On E-5D and -2D, the “Cycle Sensor Power” will cause the “AUX PWR” terminals to cycle power. This will only be effective for the smoke detection sensor if the sensor is being powered from these terminals. If your sensor is powered, for example, from an AC adapter, the “Cycle Sensor Power” button will have no effect on that sensor, but it will still cycle power on the “AUX PWR” terminals, disrupting any device getting power from these terminals for 5 seconds. Keep this in mind if more than one sensor (or device) is being powered from these terminals.

Application Note:

A smoke detector connected to an RJ45 Sensor Port does not have “Cycle Sensor Power” button and must be manually disconnected (unplugged) and reconnected in order to reset it. To use this feature, make sure the smoke detector is wired to a Digital Input.
Cycle Sensor Power on E-MINI-LXO

The power to the smoke detector can also be power-cycled on the E-MINI-LXO when wired as shown on the lower image on page 4. If the output relay is used to control power to the smoke detector, the output relay can be manually activated (to open power to the smoke detector) and then deactivated (to restore power to the smoke detector).

When wired in this fashion, make sure that none of the sensors are configured to have the output relay status change to “Active”. Both fields (below) must be set to “inactive”. Otherwise, when the relay is active the smoke detector will be powered OFF.

Make sure the ENVIROMUX Output Relay status for both fields in all sensor configurations is set to “Inactive” if the output relay is used to power the smoke detector.

To power-cycle the smoke detector using the web interface, set the output to “Activate”, click “Apply Changes”, then set to “Deactivate” and click “Apply Changes” again.

### Data Logging

**Example of sensor configuration in E-MINI-LXO**
New Sensor Configuration

Example of sensor configuration in E-16D/-5D/-2D

For the E-MICRO-T(RHP) and E-1W(P), configuration of an alert provides the desired response from a sensor connected to digital inputs.

Configure Alert

Example of alert configuration in E-MICRO-T(RHP) or E-1W(P)
Specifications

- Operating Voltage: 9-15VDC
- Operating current: Standby 8mA (N/O) 15mA(N/C) Alarm 15mA(N/O) 8mA (N/C)
- Relay Contact Rating: 100mA @ 28VDC
- Alarm Output: Relay Output
- Alarm Indicator: LEDs (Red)
- Sensitivity: 0.5dB/m ±0.1dB/m
- Temperature Range: -10º to 50ºC
- Humidity: 0% to 95% R.H. (non-condensing)
- Dimensions: 103 X 53mm (4.0 X 2.1 in.)
- Standard: RoHS

Warranty Information

The warranty period on this product (parts and labor) is two (2) years from the date of purchase. Please contact Network Technologies Inc at (800) 742-8324 (800-RGB-TECH) or (330) 562-7070 or visit our website at http://www.networktechinc.com for information regarding repairs and/or returns. A return authorization number is required for all repairs/returns.
