Before APP Installation

You have to connect the Host (TX) / Client (RX) / Ethernet Switch / Access Point (Wi-Fi router) together. Connect your mobile phone by Wi-Fi and set the IP address at same subnet as the Host / Client. The System default IP setting is Auto IP, it will assign 169.254.X.X (subnet mask 255.255.0.0) to hosts and clients. You can also set to DHCP or Static IP. Refer to the user manual's web setting chapter: IP Setup.

Methods to get the IP address of receiver:

- 1. Connect monitor with receiver, **local IP** shows on right bottom of screen when receiver is booting without transmitter connected (or no video input)
- 2. Press remote control button *MENU, 1, ENTER* (Network Information). The receiver IP address will be displayed on the screen

Methods to get the IP address of transmitter:

1. Connect monitor with receiver, connect receiver with transmitter and set in the same channel. The **remote IP** address will display on the right bottom of the screen when receiver booting with no video input from transmitter

Set IP address of transmitter/receiver by command:

Press and hold panel button "+" then power on to set factory defaults and enter engineering mode. In engineering mode the "ON" and "Link" LEDs will flash together, the IP address of unit will be set to Static IP of 192.168.0.88 temporarily. You can login to the web page by browser and change IP settings in API commands column as listed below (**x** can be one of numbers **1~254**):

astparam s ip_mode static astparam s ipaddr **169.254.x.x** astparam s netmask **255.255.0.0** astparam save

Commands can be applied one by one, or connected using ";" apply all at once as shown below: astparam s ip_mode static; astparam s ipaddr **169.254.x.x**; astparam s netmask

255.255.0.0; astparam save

You can also use a private IP address/subnet mask you prefer like 192.168.x.x/255.255.255.0
